What is UiPath Maestro Case ?

Maestro Case concepts for long-running, exception-heavy work, including case management use cases, tool surfaces, and core design components. It orchestrates long-lived, goal-driven work about a specific situation — a case. A case holds data, rules, tasks, and history to drive an auditable outcome such as a refund, a claim decision, or an investigation closure.

Canvas-Based	Rule-based stage transitions and re-entry	SLA tracking	Case App for collaboration
Adds a visual stage canvas to define sequential stages and transitions	Enables rule-based stage transitions and re-entry to the exact task within a previous stage	Supports SLA tracking at case, stage and task levels, with escalation rules and pause/resume	Delivers Case App for collaboration, task management, and visibility

Case processes run as agentic processes in Orchestrator - alongside RPA workflows, API workflows, AI agents and Human tasks via Action apps.

Note : If the next step depends on what just happened and no single flowchart can capture every path, consider case management.

Core Components

Case blocks, lifecycle rules, and stages

Case Components

Triggers

The business event that initiates a new case in Maestro.

Stages

High-level business phases that define the case lifecycle.

Tasks

Individual activities performed by humans, robots, agents, or APIs within a stage.

Rules

Conditions that control stage activation, completion, exit, and re-entry.

Personas

Business roles responsible for owning and executing case tasks.

Stages

- Intake – Receive and register the case.
- Verification – Validate documents and information.
- Investigation – Perform additional analysis if required.
- Approval – Human or automated decision.
- Closure – Complete and archive the case.

Tasks & Personas

- Human Tasks – Reviews, approvals, validations.
- Robot Tasks – UiPath workflows.
- AI Agent Tasks – Intelligent decision support.
- API Tasks – External system integrations.
- Personas – Case Owner, Worker, Supervisor, SME.

Primary vs Secondary Stages

→ Primary Stages

Sequential Happy Path: Represents standard, predictable process phases (e.g., Intake → Review → Settlement → Closure).

Order-Bound Execution: Arranged chronologically from left to right. Triggers sequentially as preceding stages finish normally.

↔ Secondary Stages

Dynamic Exception Paths: Handles deviations like document requests, case denials, or user withdrawals.

Decoupled Activation: Incoming edges are removed. Activates from anywhere whenever its rule condition evaluates to true.

Maestro Case Ecosystem

Maestro Case Ecosystem

UiPath Community

The Case App is distinct from UiPath Apps. The Case App is purpose-built for case operations. UiPath Apps is a general-purpose low-code builder for fully custom or composite business apps

Coordinating the Enterprise Automation Stack

Design-Time Components → Runtime Orchestration

Design-time defines the Case Plan, while Runtime executes and manages live business cases through the Case Manager and Case App.

Stage Lifecycle Rules

Rules determine when a stage starts, finishes, exits, or reopens. They are evaluated continuously by the Case Manager during runtime.

Re-entry enables iterative business processes while preserving audit history.

100%

Non-Linear Flexibility

Granular Task-Level Control

When configuring re-entry or rework loops, Maestro allows per-task execution settings via the `runOnlyOnce` flag:

-  **`runOnlyOnce: true`** — Skips task execution on stage re-entry, retaining previously calculated outputs.
-  **`runOnlyOnce: false (Default)`** — Re-executes task to generate fresh output during rework.

End-to-End Claim Case Stages

UiPath Community

Design for modularity, reliability, and efficient execution

Case Monitoring

Case Incident and Instance monitoring

Real-Time Instance Monitoring & Incident Management

UiPath Community

REAL-TIME METRICS

Active Instances Dashboard

- **Execution Visibility**

Provides aggregated view of all running vs. faulted instances across processes.

- **State Tracking**

Filters case runs by status: Running, Completed, Faulted, Suspended, or Cancelled.

- **Duration & Bottlenecks**

Tracks runtime duration per case to detect SLA risks and long-running steps early.

ROOT-CAUSE TRIAGE

Process Incidents Table

- **Fault Aggregation**

Consolidates all unresolved incidents grouped by specific error messages per process.

- **Triage Velocity**

Displays elapsed time since first occurrence to prioritize critical failures.

- **Direct Navigation**

Jump straight from error clusters into the specific faulted instance execution graph.

GOVERNANCE & AUDIT

Traceability & Execution Trail

- **Step-Level Diagram**

Visual instance diagram highlighting completed, active, and faulted nodes.

- **Actor & Robot Identity**

Logs exact user, AI agent, or RobotUserName responsible for every action.

- **Variable State Capture**

Records input/output variable changes and write-backs for end-to-end compliance.

Managing Live Case Instances

EXECUTION HOLD

PAUSE & RESUME

Gracefully halts instance execution immediately after current atomic tasks complete.

- ✓ Use Case: External system outage or required manual data audit.
- ✓ Integrity: Completes in-flight steps before holding downstream triggers.
- ✓ Resume: Re-enables seamless forward progression with preserved state.

FAULT RECOVERY

RETRY & RESTART

Restarts all activities from the last completed checkpoint after resolving transient errors.

- ✓ Use Case: API timeout, token expiration, or connector failure.
- ✓ Variable Editing: Adjust payload values/variables prior to initiating retry.
- ✓ Audit Trail: Generates a logged action history record with reason comments.

VERSION LIFECYCLE

MIGRATE (UPGRADE)

Hot-upgrades running case instances to a newer published Case Plan version.

- ✓ Use Case: Deploy bug fixes or enhanced stage rules to live long-running cases.
- ✓ State Preservation: Preserves completed stage history and case entity data.
- ✓ Zero Disruption: Eliminates need to abort and re-enter existing cases.

SEQUENCE ALTERATION

MOVE & CANCEL

Relocates execution pointer or terminates run with automated cleanup.

- ✓ Move Action: Manually reroute faulted/paused instances to any element.
- ✓ Cancel Action: Halts case and auto-deletes pending Action Center user tasks.
- ✓ Compliance: Every intervention requires audit-logged reason notes.

Building a Case

Access the Studio web and create the Maestro Case

UiPath Community

Start with Case Management Project

Ensure your environment and resources are configured prior to creating a generic Maestro Case project.

1. Platform & Studio Web Access

An active **UiPath Automation Cloud** tenant with access to Studio Web and Maestro Case design capabilities.

- Automation Cloud tenant access
- Studio Web design environment

2. Data Fabric Entity Schema

Pre-defined **Data Fabric Entity** structure representing the case record schema, key fields, and status properties.

- Case entity data model
- Required & optional field definitions

3. Integration & Triggers

Enabled **Integration Service** connectors or API endpoints to automatically instantiate new case instances.

- Connector connections configured
- Event triggers or Webhooks active

4. Human Task Services

Access to **Action Center** and **Case App** for operational user task assignments and human-in-the-loop workflows.

- Action Center queue configuration
- Case App user permissions

5. Automation Resources

Deployed RPA processes, API workflows, or AI Agents ready to be referenced as task nodes within case stages.

- Published Orchestrator processes
- Configured AI / Integration agents

6. Runtime Case Key Prefix

Standardized case key prefix convention (e.g., CASE-, TKT-) to auto-generate unique sequential case IDs.

- Constant or variable key policy
- Unique instance identifier tracking

7-Step Case Project Creation Lifecycle

High-level generic framework for building and deploying any Case Management project in UiPath Maestro.

STEP 1

Creating the Case

Open Studio Web, create a **Case Management Project**, define project parameters, case title, and set the sequential case key prefix.

STEP 2

Setting Up Case Trigger

Define what event initializes a new case instance (e.g. Data Fabric row creation, API payload, or connector event) and map incoming fields to case variables.

STEP 3

Modeling Primary Stages

Design the sequential, happy-path lifecycle phases (e.g. Intake, Processing, Approval, Closure) on the visual canvas.

STEP 4

Adding Tasks to Stages

Populate stages with work items combining Human Actions, RPA robots, API workflows, AI Agents, or Child Cases with input/output data mappings.

STEP 5

Adding Primary Stage Rules

Configure stage progression rules combining **WHEN** events, **IF** conditions, and **ACTIONS** (Entry, Complete, Exit, and Re-entry rules).

STEP 6

Configuring Secondary Stages

Establish non-linear or exception-handling stages that interrupt or branch off the primary lifecycle when specific conditions occur.

STEP 7

Configuring the Case App & Deploying

Customize the operational workspace for case workers (title fields, detail views, task queues), validate project logic, and deploy the case plan to runtime.
