Introduction to UiPath Maestro

Case Management & Maestro Flow

From fixed workflows to dynamic, exception-ready orchestration - a practitioner's walkthrough of Maestro's Case Management and Flow.

Meet the team!

Agenda

Introduction to Maestro family

Maestro Case Management & its Lifecycle

UiPath Maestro Flow

BPMN vs. Flow vs. Case Management

Key Takeaways

Q & A

What is UiPath Maestro?

UiPath Community

A cloud-native orchestration platform that unifies automation, AI agents, and human interactions into one governed, end-to-end business process.

B PMN

Standards-based, structured process diagrams for predictable, fixed-sequence work.

F low

Developer-first, structured and sequential workflows - built for coders.

C ase Management

For long-running, exception-heavy work that can't be fully defined upfront.

BPMN and Flow run on the same Maestro engine. All three approaches share UiPath platform services - a Case can even invoke a BPMN process as one of its task types.

What is UiPath Maestro Case Management?

Maestro Case orchestrates long-lived, goal-driven work about a specific situation — a case. A case holds data, rules, tasks, and history to drive an auditable outcome such as a refund, a claim decision, or an investigation closure.

Maestro Case addresses scenarios that are exception-heavy, non-linear, and dependent on human and AI agent judgment at key decision points. A case represents a real-world business situation that needs to be resolved. Examples include:

“A case is **persistent** & lives from its creation until its resolution. Along the way it accumulate **things** data, tasks, decisions, and history.”

! Insurance claims

! Disputes

! Loan applications

! Compliance investigations

Where Case Management fits within the UiPath Platform?

03

Case Orchestration

Long-running work with persistent entities, adaptive stages, and SLAs
When the entity persists, the path is dynamic, and humans are in the loop

You are here

02

Business Process Orchestration

End-to-end process flows — deterministic, structured, event-driven
When the path is predictable and can be fully mapped in advance

Use for predictable flows

01

Task Orchestration

Individual automations — robots, agents, API calls, discrete actions
The building blocks that Case and Process layers coordinate

The building blocks

Three layers of orchestration — each handles a different kind of work. Case Management is the top layer.

Why Case Management?

Case management addresses challenge where many business scenarios are complex.

These processes may span days or weeks, involve multiple teams, and require decisions that cannot be fully automated by providing structure without rigidity. Unlike traditional process automation, that works best when the flow of work is predictable and repeatable.

Pain points that case management solves

Pain Point	How Case Management Addresses It
No persistent case construct or lifecycle tracking	<i>Introduces a case entity [Coming Soon] with full lifecycle, state, and history</i>
No native stage modeling	<i>Adds a visual stage canvas to define sequential stages and transitions</i>
No design-time transition or targeted re-entry	<i>Enables rule-based stage transitions and re-entry to the exact task within a previous stage</i>
Limited SLA and escalation control	<i>Supports SLA tracking at case, stage and task levels, with escalation rules and pause/resume</i>
No unified experience for case workers and managers	<i>Delivers Case App for collaboration, task management, and visibility</i>
No flexibility for ad-hoc work	<i>Allows runtime ad-hoc task creation for exceptions or additional reviews</i>

Understanding Cases, Tasks, Stages, SLAs, Rule & Lifecycle

Case

- Maintains the case data and lifecycle state.
- Identified by a Case Key.
- Acts as the central context throughout the lifecycle.

Task

- Discrete units of work inside a stage.
- Can be performed by Humans, RPA, API workflows, Connectors, AI Agents, External Agents, Agentic Processes, Child Cases, or waiting mechanisms.

Stage

- Primary stages represent the expected/happy path.
- Secondary stages represent exception or alternative paths.
- Stages can run sequentially or in parallel.

Rules

- Control how the case progresses.
- Include Entry, Complete, Exit, and Re-entry rules at the stage level.
- Evaluate events and conditions against case data and determine the next action.

Understanding Cases, Tasks, Stages & Lifecycle

Case Manager

- Evaluates rules and determines which stages/tasks should activate, complete, exit, or re-enter.
- Uses deterministic rules first, with Case Manager Agent reasoning available for situations not covered by rules.

The screenshot shows the 'Case app' dashboard. At the top, there are four summary cards: 'Open cases' (0), 'SLA-breached cases' (2), 'SLA compliance rate' (60%), and 'SLA risk' (0). Below these is a table of 'Active cases' with columns for Case ID, Case type, Last modified, Stage, Case SLA, SLA status, and Case state. The table contains six rows of data.

Case ID	Case type	Last modified	Stage	Case SLA	SLA status	Case state
CMP-726414859	Maestro Case	Sep 8, 12:16 PM	Intake	Sep 8, 12:16 PM	Overdue	Faulted
CMP-726414860	Maestro Case	Sep 8, 12:16 PM	Intake	Sep 8, 12:16 PM	Overdue	Faulted
CMP-726413669	Maestro Case	Sep 6, 12:11 PM	Feedback	Sep 8, 12:11 PM	Completed	Completed
CMP-726412386	Maestro Case	Sep 6, 12:06 PM	Intake	Sep 8, 12:06 PM	Completed	Cancelled
CMP-726409679	Maestro Case	Sep 6, 11:56 AM	Intake	Sep 8, 11:56 AM	Completed	Cancelled

SLAs & Escalations

- Stages can have SLAs defining expected completion times.
- SLA states include On-track, At-risk, and Breached.
- Escalation mechanisms support managing overdue or at-risk work.

Lifecycle

UiPath Community

Meet Maestro Flow

What is UiPath Maestro Flow?

An AI-native orchestration surface for building, evaluating, and deploying automations that connect APIs, AI agents, and enterprise services - designed as the orchestration layer of the UiPath Platform.

- Design processes by placing nodes on a canvas and connecting them
- Author in Studio Web or directly in VS Code
- Runs on the same UiPath Maestro runtime that powers BPMN and Case
- Publish and deploy from Orchestrator; monitor from Maestro Instance Management
- Flow processes run as agentic processes, alongside RPA workflows, API workflows, and AI agents

FLOW CANVAS

Trigger

Action: Call API

Gateway: Decision

Action: Run Agent

Human Task

End

WHY THIS MATTERS

Not every process follows a script

52%

of C-suite & IT leaders at \$1B+ enterprises say hybrid workflows - a mix of fixed, repeatable steps and dynamic, context-dependent work - define their daily operations.

Traditional BPMN needs a fixed sequence defined before execution - it breaks when new information changes the path.

KYC investigations, insurance claims, and loan files don't follow scripts: each accumulates data, participants, and history as it moves toward resolution.

Dynamic work often ends up managed through disconnected emails, spreadsheets, and point solutions - creating delays and inconsistent outcomes.

Maestro Flow: A Peer, Not a Layer

Flow also shares the same Maestro runtime as BPMN and Case Management - that's why a Case can invoke a BPMN process as one of its steps.

Understanding the building blocks

T

Triggers

WHAT STARTS A RUN

Manual Trigger for on-demand runs, or Scheduled Trigger to run on a recurring cadence - the entry point into every Flow.

A

Actions

WHAT DOES THE WORK

Call an API, run an RPA workflow, invoke an agent, transform data, or extract from a document - the executable steps in the graph.

G

Gateways

WHAT CONTROLS THE PATH

Decision and Switch nodes branch execution based on conditions; Loop and Merge nodes handle repetition and rejoining paths.

H

Human Tasks

WHERE PEOPLE STEP IN

Pause a process until a person reviews and approves - bringing human-in-the-loop judgment into an otherwise automated run.

Common Enterprise Use Cases

1

API Integrations

CALL & ROUTE ENDPOINTS

Call any REST endpoint, transform the response, and route it downstream to the next step.

Example: the 3-way match in Purchase-to-Pay - calling ERP systems to check an invoice against its PO and goods receipt.

2

AI Agent Orchestration

TRIGGER, WAIT, BRANCH

Trigger UiPath agents, wait for results, and branch the process on their output.

Example: an agent reviewing the invoice and returning a structured approved or rejected decision to branch on.

3

Human Approval Workflows

PAUSE FOR REVIEW

Pause a process until a person reviews and approves before it continues.

Example: an Invoice Approval task showing the amount, requester, and document, with Approve/Reject outcomes.

4

Document Processing

EXTRACT & ROUTE

Extract structured data from documents with IXP models and route it downstream.

Example: pulling the invoice amount and line items off the submitted PDF before it's matched and reviewed.

Where and how enterprises can apply Maestro family

Flow

Invoice Processing & ERP Sync

Invoices extracted with IXP, validated against PO data via API calls, and posted straight to ERP - no case handling needed

Case Management

Claims Processing

Dynamic investigation paths that adapt as new claim evidence arrives

BPMN + Flow

Purchase-to-Pay

Predictable approval chains with automated matching and exceptions routed to Case

Case Management

KYC & AML Investigations

WorkFusion agents (acquired Feb 2026) plugged into a governed case lifecycle

BPMN vs. Flow vs. Case Management

BPMN

BEST FOR
Standards-based structured diagrams

PATH KNOWN UPFRONT?
Yes - fixed sequence

PRIMARY AUTHOR
Process analysts

TYPICAL USE
Purchase-to-pay, approvals

Flow

BEST FOR
Developer-first sequential logic

PATH KNOWN UPFRONT?
Yes - structured & sequential

PRIMARY AUTHOR
Developers (canvas or VS Code)

TYPICAL USE
API / agent orchestration pipelines

Case Management

BEST FOR
Long-running, exception-heavy work

PATH KNOWN UPFRONT?
No - decided dynamically

PRIMARY AUTHOR
Business + case management agents

TYPICAL USE
Claims, KYC/AML, loan underwriting

WRAPPING UP

Key takeaways

1

Maestro now spans three complementary approaches - BPMN, Flow, and Case Management - all on one governed platform

2

Use Flow when the path is known and you want developer-first control; use Case when exceptions are the norm

3

Maestro Case treats each case as a living record - data, participants, and timeline travel with it across every stage

4

A Case can invoke a BPMN process as a task - the three approaches are meant to work together, not compete
